

I was most confident using semantic HTML elements such as `<header>`, `<nav>`, `<article>`, and `<footer>` because they helped me organize the webpage clearly. One challenge I encountered was planning the structure before coding because I needed to decide which HTML elements matched each section properly.

Semantic HTML helped organize my content by making the page more meaningful and easier to understand for both users and developers. It also improves accessibility for screen readers. In my next HTML project, I would improve the design further by adding CSS styling and making the webpage responsive for mobile devices.
